

2007 TIGER/Line® Shapefiles

HOW WERE THESE FILES CREATED?

The 2007 TIGER/Line Shapefiles are extracts of selected geographic and cartographic information from the Census Bureau's MAF/TIGER (Master Address File/Topologically Integrated Geographic Encoding and Referencing) database. MAF/TIGER was developed at the Census Bureau to support the mapping and related geographic activities required by the decennial and economic censuses and sample survey programs. The TIGER/Line® Shapefiles consist of the following five files:

- .shp - the file that stores the feature geometry
- .shx - the file that stores the index of the feature geometry
- .dbf - the dBASE, or database, file that stores attribute information
- .prj - the file that stores the coordinate system information
- .shp.xml - the file that stores the metadata

The associated relationship files consist of the following two files:

- .dbf - the dBASE, or database, file that stores additional attribute information
- .dbf.xml - the file that stores the metadata

WHAT IS IN THE FILES?

The following is the list of files included in the 2007 TIGER/Line® Shapefiles and relationship files. (Note: In the file names, <ENTITY> stands for the two-digit state code in the case of a state-based shapefile, the combined 5-digit state and county code in the case of a county-based shapefile or relationship file, and the 4-digit American Indian/Alaska Native/Native Hawaiian Area code in the case of an American Indian Area-based (AIA-based) shapefile. Nation-based shapefiles include "us" instead of an entity code.)

SHAPEFILE *.PRJ

Every shapefile produced contains an associated projected (PRJ) file. The PRJ is a simple text file that contains the GIS industry standard well-known text (WKT) format to describe the coordinate system/projection/datum information for each shapefile enabling users to easily import the shapefiles into their local coordinate system. All Census Bureau generated shapefiles are in GCS NAD83¹, and each PRJ file will contain the following:

```
GEOGCS["GCS_North_American_1983",DATUM["D_North_American_1983",SPHEROID["GRS_198  
0",6378137,298.257222101]],PRIMEM["Greenwich",0],UNIT["Degree",0.017453292519943295]]
```

¹ There are a few island areas in TIGER that have not gone through the NAD83 transformation process and are still within local astronomical datums. They are typically small uninhabited islands in the Northwestern Hawaiian Island chain (i.e., islands northwest of Oahu), Commonwealth of the Northern Mariana Islands (i.e., small islands north of Saipan), and American Samoa outer islands (i.e., Rose and Swains Islands).
